In this version of the app, the program has a new “Smart Fix” function. The feature, which is also available as a standalone program, allows you to remove certain types of distortion from images — a technique you could refer to as “photo flipping.” It’s a handy tool to have, but I believe that it is not as sophisticated as Google’s HDR for Mobile, which uses machine learning to estimate the imagery used in each picture, regardless of the smartphone’s dimensions. Neither is the “Smart Fix” tool as feature-rich as Nik Software’s ISP Repair, which the company calls “Lens Correction 1.0.” This software application uses a calibration setting to correct for certain known flaws in your camera, as well as certain image offsets. A balance is struck here, since the performance of such programs is inversely proportional to their price tags. I’ve used Google’s HDR for Mobile a few times and I like it, but the same method works only with cameras from the same manufacturer (Google does not make user-friendly apps for other smartphone makers). It often takes several attempts to get the app to work properly, so I will not use it in my own photography. The same can be said about Nik Software’s software application. I much prefer a smart “photo flipping” feature that comes on top of my smartphone’s image processing needs. In any case, the Smart Fix function is a welcome addition to any image editing app. I have used the app in the past, but I should perhaps mention that it was not always easy to use. And the same is true for the Smart Fix feature, which can take some time to learn.
