You can use Photoshop to make adjustments to the pixels in any artwork. You make those adjustments by selecting different areas—for example, you might select a specific color—and then doing one of several things to that selected area. You can edit the specific color on its own or you can edit the color's values, such as hibiscus pink, full of oranges, and postal blue, to name a few. You can also apply effects to the selected area, such as blurring it, moving it around, or even turning it transparent. You often do all of these things at once. The two most common ways you can apply adjustments to pixels in an image are with the Brush tool and the Eraser tool. The Brush tool adjusts a color when you paint with it, making overpainting easier. The Eraser tool operates much like the brush, but it erases pixels when you take your finger off the screen. You can erase colors, flatten areas, adjust the contrast of an image, and more. If you want to modify pixels in an image, use the Brush tool or the Eraser tool. The first step to using these tools is to select an area of an image. For most images, this involves drawing around an area you want to apply an adjustment to with the Brush tool. The Brush tool uses the Color Picker to select a color. You can change a color's color by tapping and holding on a color that looks good to you. You can also use the Color Picker to use a preset color that looks good to you. You change the brush size to change the amount of paint that's applied when you paint. You can also change the brush hardness, by clicking on the top of the box. You can, for example, adjust it to fade from a hard circular shape to a soft brush that blends with itself. e3d0a04c9c
